AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA3730 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
                                                                                                                                                                                                     Claim
                                                                                                                                                                                                                                   New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions

                                                           The present sequence is a human PRO polypeptide (secreted and transmembrane). The PRO protein, and PRO agonists, PRO antagonists or anti-PRO antibodies are useful for preparation of a medicament useful in the treatment of a condition which is responsive to the PRO protein, agonists, antagonists or anti-PRO antibodies. The PRO protein may also be employed as molecular weight markers for protein electrophoresis. The PRO coding sequence has applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pan

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC The invention relates to one hundred and twenty two nucleic acids CC encoding PRO polypeptides. The sequences of the 122 PRO polypucleotides CC encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. CC Cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or CC cliver tumour. The PRO polypeptides are useful for stimulating the CC proliferation of, or gene expression, in pericyte cells, for stimulating the release of tumour necrosis factor alpha from human blood, for stimulating or inhibiting the proliferation of nordifferentiation of chondrocyte cells, for stimulating or inhibiting the proliferation of normal human dermal CC fibroblast cells. The PRO polypeptide may also be used as molecular cells that the proliferation of normal human dermal complications in molecular blology, including use as hybridisation probes, and in chromosome and gene mapping. AAU83592-AAU83713 represent human PRO content sequences of the invention.

a method for producing the CDHN proteins by culturing a transfected host cell line with a vector containing the CDHN proteins and an antibody which selectively binds to the protein. The CDHN proteins and an containing the CDHN proteins and an antibody which selectively binds to the protein. The CDHN proteins may have nootropic, neuroprotective, cardiant, antiinflammatory, gastric, immunostimulant and cytostatic activity and can be used so cadherin-modulators using antisense-therapy or gene-therapy. These proteins are useful for identifying compounds which bind or modulate CDHN-1. The proteins, nucleic acids and antibodies are useful for treating a subject with a disorder characterised by aberrant or unwanted cadherin protein or nucleic acid activity. These disorders include central nervous system (e.g. Alzheimer's disease, parkinson's disease, multiple sclerosis), cardiovascular, (e.g. atherosclerosis, angiogenesis), musculoskeletal (e.g. ataxia, myotonia) gastrointestinal (e.g. gastritis, insulin dependent immune system (e.g. asthma, rheumatoid arthritis, lupus) or cell proliferation disorders (e.g. cancers, leukaemia) and many other conservative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                                    The patent discloses a method of female primate contraception comprising administering an antagonist of a wnt polypeptide, inhibiting occyte development. Wnt polypeptides are useful for promotive maturation of an immature occyte. Wnt polypeptides are also useful for increasing the number of mature occytes and to enhance occyte viability. Soluble fragments of wnt polypeptides have the ability to inhibit Wnt signalling, e.g., by blocking binding of a naturally-occurring Wnt protein to its receptor. They may be used to generate monoclonal antibodies which can inhibit occyte development. The present sequence is the human N-cadherin. Signal transduction by beta-catenin is mediated by binding to the cytoplasmic domain of a cadherin. Domainant negative mutants of N-cadherin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human N-cadherin; Wnt antagonist; contraceptive; contraceptive vaccine;

```
The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as CC a food supplement. (II) and its binding partners are useful in medical considers involving aberrant protein expression or biological activity. CC imaging of sites expressing (II). (I) and (II) are useful for treating CC diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess blodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed content function, but was obtained in electronic format directly from WIPO as format directly from WIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       31-MAR-2000;

beta-catenin comprising a gene therapy vehicle harbouring a polynucleotide that contains: (a) a nucleotide sequence encoding an o-catenin; and (b) an upstream promoter for directing expression of the o-catenin in a mammalian cell. The pharmaceutical compositions have cytostatic activity and can be used in the suppression of beta-catenin-mediated transactivation. They can be used for treating cancers associated with abnormally high activity levels of beta-catenin in mammalian cells. The present sequence represents human N-cadherin which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                  polynucleotide that contains: (1) a nucleotide sequence encoding a soluble cytoplasmic portion of a cadherin which lacks a transmembrane portion and an extracellular portion of the cadherin, and includes a beta-catenin binding domain; and (b) an upstream promoter for directin expression of the soluble cytoplasmic portion of the cadherin in a mammalian cell. Also described is a pharmaceutical composition for treating cancer associated with abnormally high activity levels of

The CP pharmaceutical composition comprises a gene therapy vehicle harbouring a CC polynucleotide that contains: (1) a nucleotide sequence encoding a CC soluble cytoplasmic portion of a cadherin which lacks a transmembrane CC portion and an extracellular portion of the cadherin, and includes a CC beta-catenin binding domain; and (b) an upstream promoter for directing CC expression of the soluble cytoplasmic portion of the cadherin in a CC mammalian cell. Also described is a pharmaceutical composition for CC treating cancer associated with abnormally high activity levels of EC beta-catenin comprising a gene therapy vehicle harbouring a CC o-catenin; and (b) an upstream promoter for directing expression of the catenin; and (b) an upstream promoter for directing expression of the catenin in a mammalian cell. The pharmaceutical compositions have CC cytostatic activity and can be used in the suppression of the cancers associated with abnormally high activity levels of beta-catenin catenin in mammalian cells. They can be used for treating cancers associated with abnormally high activity levels of beta-catenin catenin in mammalian cells. The present sequence creates thicken N-cadherin which is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a cgene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive consciously considered for a schaemia, occlusive ischaemia or vasospastic ischaemia) by measuring cexpression levels of particular genes (AB199202 to AB19912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the cexpression profile of a gene group comprising these genes. The cused as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases. AB19913 and AB19914 crepresent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.

           This sequence represents human cadherin-4. The invention specifically c provides details of human cadherin-5, -8, -11, -12 and -13, and rat cadherin-8, -5, -11 and -13. Cadherins are calcium-dependent cell adhesion proteins. They are glycosylated integral membrane proteins that have an N-terminal extracellular domain that determines binding specificity, a hydrophobic membrane spanning region and a C-terminal cytoplasmic domain, which is highly conserved among members of the superfamily. The C-terminal domain interacts with the cytoskeleton through eatenins and other cytoskeleton-associated proteins. The coadherin proteins may be used in the analysis of the role of cadherin. The cadherin proteins may be isolated by using anti-cadherin cadherin. The cadherin proteins may be isolated by using anti-cadherin also allows investigation of the structure and function of cadherin. The cadherin proteins may be isolated by using anti-cadherin may be used to modulate the activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                    19-APR-1993;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is full length human cadherin-4, whi is a Ca2+ dependent cell adhesion protein. The human cadh was isolated from a foetal brain cDNA library, using prob on homologous rat cadherin cDNA.

Antibodies or fragments that specifically bind the human can be used to purify the cadherin, determine its tissue and antagonise its ligand/antiligand binding activities.

                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences coding for proteins having monocyte and macrophage migration factor activity were isolated from a cDNA library prepared from human HT-1376 cells (ATCC CRL-1472). The proteins encoded by the isolated cDNA clones are useful as immunopotentiators for treatment of infections, immune deficiency diseases and cancer. The proteins are also useful in wound healing preparations and for treatment of skin diseases.

Sequence 1081, Application US/09833263
Patent No. US20020110547A1
GENERAL INFORMATION:
APPLICANT: Wang, Aljun
APPLICANT: Clapper, Jonathan D.
APPLICANT: Stolk, John A.
APPLICANT: Meagher, Modeleine J.
TITLE OF INVENTION: COMPOUNDS FOR IMMUNOTHERAPY AND TITLE OF INVENTION: DIAGNOSIS OF COLON CANCER AND METITIE REFERENCE: 210121.471C12
CURRENT APPLICATION NUMBER: US/09/833,263
CURRENT FILING DATE: 2001-04-10
NUMBER OF SEQ ID NOS: 1093
SOFTWARE: FastSEQ for Windows Version 3.0
SEQ ID NO 1081
LENGTH: 832
TYPE: PRT
ORGANISM: Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
